

My CS-2 Reflection

By Ashton Zac G. de Veyra

When I first started 8th Grade, I knew from the start that Computer Science 2 would be challenging. I knew that the difficulty of coding and problem solving would be a lot more intense compared to 7th Grade, and therefore I wasn't excited for it. But now that this project has come to Sean Lester Villarin and I, I realized that Computer Science isn't something to fear, but rather a subject to view as an adventurous journey.

During this project, Sean Lester and I underwent a lot of brainstorming, which made the process long but fun. Once we reached our idea, we started building the basis of our code, up until the final version. From this, we were able to reflect a lot about what we learned. We learned the basis of python programming, including functions, defined functions, data types, and linear programming. From our process, we got to learn about the fundamentals of programming, and therefore we were able to successfully finish our project.

Overall, we learned many things. We also came to realize that long term projects like this must be handled with patience and carefulness, since facing this project in a hurried way can have a huge impact on our final result. We also know that our process wasn't perfect, as sometimes we had arguments and conflicts regarding the code's structure and features. However, these conflicts didn't falter us, but rather it motivated us to work better as a pair and look forward to treating each other with more respect and kindness. Without respect, we definitely wouldn't have come to the result we have today. We look forward to what's to come next school year, especially in Computer Science, and we hope that we try our best while modeling academic integrity and honesty.
